Wahyudi

SDET / QA Automation Engineer

hi@wahyudi.dev · wahyudi.dev · github.com/halowahyudi

SUMMARY

QA automation engineer who turns manual regression into deterministic, CI-driven test suites. I build API and end-to-end automation with **Playwright**, **Postman/Newman** and **k6**, wire them into **CI/CD** quality gates, and bring a security-aware mindset to testing — finding defects through negative and boundary test cases, not just happy paths.

EXPERIENCE

SDET / QA Automation Engineer — Independent, various clients

- Design and maintain **API test suites in Postman** and run them in CI via **Newman**, catching contract and validation regressions before release.
- Build **end-to-end browser tests with Playwright**, replacing fragile manual regression passes with repeatable, parallelized runs.
- Write **performance tests with k6** to validate load behavior on critical endpoints and surface latency and error-rate regressions early.
- Integrate tests into **GitHub Actions** and **GitLab CI** pipelines as quality gates, so merges are blocked on failed tests.
- Apply **shift-left testing** — review requirements and designs for testability, and define acceptance criteria before implementation.
- Write reproducible bug reports with clear steps, expected vs actual, evidence and severity, usable by developers and PMs without back-and-forth.

Software Engineer — Independent, various clients

- Ship full-stack web applications (TypeScript, Next.js/NestJS, Laravel) with testability built in from the start.
- Own features end to end — including the automated tests and CI checks that prove they work.

Application Security & Security Research — Independent / HackerOne

- Security-aware testing across the SDLC: threat modeling, secure code review and adversarial test cases.
- Coordinated vulnerability disclosure to major platforms — finding broken access control, authentication bypass and API authorization flaws through **negative and boundary testing**.

QA SKILLS

Test Automation: Playwright (E2E), Postman + Newman (API), k6 (performance)

Testing Types: API, E2E, integration, regression, boundary & negative testing, smoke

Languages: TypeScript / JavaScript, PHP

CI/CD: GitHub Actions, GitLab CI, Jenkins — test quality gates

Test Design: Test plans, test cases, acceptance criteria, bug reporting, shift-left QA

Security-aware QA: OWASP Top 10, access-control & input-validation test cases

PROJECTS

Gembok — encrypted password manager & authenticator gembok.dev

Android vault for passwords, cards and TOTP 2FA codes, independently built and maintained — from requirements and edge-case planning through release and support.

Kotlin · Android · Kotlin/Compose UI

Spotify API Scraper github.com/halowahyudi/spotify-api-scraper

Metadata extraction tool built with careful handling of API responses and failure cases.

Node.js · TypeScript · Puppeteer
